Education

California State Polytechnic University Pomona

Master of Science in Computer Science

New Horizon College of Engineering

Bachelor of Engineering in Computer Science

Graduated May 2025

GPA: 4.0/4.0

Graduated May 2023

CGPA: 3.75/4.0

Technical Skills

Languages: TypeScript, JavaScript, Python, Java, SQL, Go, HTML/CSS, Solidity

Frontend, Backend & Databases: React, Next.js, Node.js/Express, GraphQL, REST APIs, Spring Boot, Flask, PostgreSQL, MongoDB, Firestore, Cosmos DB

Cloud, DevOps & Testing: AWS, GCP, Azure DevOps, Docker, Kubernetes, CI/CD, Selenium, Playwright, JUnit, Postman

Machine Learning & AI: Prompt engineering, agentic coding workflows (Claude Code, Cursor), LLM APIs (Gemini, Claude), PyTorch, CNNs, YOLO, ARIMA

Experience

GlobalLogic

Aug 2025 – Present

Software Development Engineer

- Designed and built an automated data-validation service (Java) for Walgreens' RxI pharmacy-inventory platform (8,000 stores, 9M+ daily patients) — a pipeline that reconciles REST API contracts against Cosmos DB, Azure Storage, and Databricks outputs, catching schema and data discrepancies before release and replacing 6 weeks of manual verification per cycle.
- Built an automated end-to-end verification pipeline of 300+ scenarios (Java, Cucumber BDD) covering DSCSA federal compliance, audits, returns, and stock-management workflows, wired into Azure DevOps CI/CD — raising automated coverage 65% and blocking regressions on every build.
- Shipped 14+ releases of a regulated, high-availability distributed system serving 9M+ patients daily — triaging production defects to root cause with backend engineers, contributing design and code reviews across Agile sprints, and presenting release readiness to external clients and stakeholders.

Method, Inc.

Jun 2025 – Aug 2025

Full-Stack Engineering Intern

- Cut internal technology-discovery time by 60% for Method's 500-engineer org by building and shipping TechDash end-to-end, a discovery platform that unified 5 fragmented catalog types into one searchable model with Google Gemini-powered natural-language search.
- Designed and enforced organization-wide authorization for Method's 500-person org by modeling a 3-tier RBAC scheme (admin/editor/viewer) with Firebase Auth middleware, server-protected routes, and indexed Firestore queries, making unauthorized access the default-hard path.
- Delivered real-time CRUD, cross-catalog entity linking, and multi-filter search by engineering full-stack modules in React, Next.js, TypeScript, and Node.js/Express backed by Firestore on Google Cloud Functions.

California State Polytechnic University, Pomona

Aug 2024 – May 2025

Computer Science Researcher, Autonomous Systems Lab

- Reduced vehicle-location update latency by 30% across 10+ simulated campus routes by building a React Native/Expo autonomous ride-sharing app integrating ROS2, GPS tracking, and YOLO-based perception.
- Authored two ASEE Conference papers on autonomous vehicles ([End-to-End Networks for Vehicle Control](#) and [Toward Equitable AV Deployment](#)), covering CNN-based vehicle control and equitable AV deployment frameworks.

Method, Inc.

Jun 2024 – Jul 2024

Software Engineering Intern

- Lifted learner engagement by 25% across 44,000+ employees by building a gamified quiz platform (React, Node.js, Firebase Functions, Firestore) with assessments, skill-mastery tracking, and leaderboards inside an enterprise learning portal.
- Accelerated quiz rollout by 30% by engineering secure 3-role workflows (admin/author/learner) with Google SSO, OAuth 2.0, JWT access control, and REST APIs over Firestore.

Projects

RackLab - Interactive 3D Data-Center Simulator | [Live Demo](#) | [GitHub](#)

- Built a browser-based data-center simulator (React, TypeScript, Three.js/React Three Fiber, Zustand) with live observability dashboards rendering real-time temperature, alert, and power telemetry from a streaming simulation loop.
- Solved UI rendering and data-flow performance at scale: isolated all simulation physics into a framework-free module consumed by the HUD, 3D scene, and mission logic, covered by 38 Vitest tests — and code-splitting cut the initial payload 78% to a 64 kB gzip entry chunk, with lint, test, build, and deploy on every push.

Basis - Stock Analysis & Trading Simulation Platform | [Live Demo](#) | [GitHub](#)

- Built a full-stack stock-research and paper-trading platform (Next.js 15, React, TypeScript, Node.js, SQLite/Drizzle ORM) serving 40+ users, designing trade processing around ledger correctness — every buy, sell, and balance update reconciles exactly, with invalid trades rejected before they touch state.
- Shipped a walk-forward-validated forecasting model that surfaces predictions only when they outperform naive baselines — refusing to show users unreliable signals — deployed via Dockerized CI/CD.
