Education

California State Polytechnic University Pomona

Master of Science in Computer Science

New Horizon College of Engineering

Bachelor of Engineering in Computer Science

Graduated May 2025

GPA: 4.0/4.0

Graduated May 2023

CGPA: 3.75/4.0

Technical Skills

Languages: Java, TypeScript, JavaScript, Python, SQL, Go, HTML/CSS

Frontend, Backend & Databases: Spring Boot, React, Next.js, Node.js/Express, REST APIs, Swagger/OpenAPI, GraphQL, object-oriented design, Flask, PostgreSQL, MongoDB, Cosmos DB, Firestore

Cloud & DevOps: Azure, AWS, GCP, Docker, Kubernetes, Git, Jenkins, Azure DevOps, GitHub Actions, CI/CD, JUnit, Rest Assured, Playwright

AI & Machine Learning: Generative AI APIs (Gemini, Claude), prompt engineering, agentic coding workflows (Claude Code, Cursor), model evaluation & backtesting, PyTorch, CNNs, YOLO, ARIMA

Experience

GlobalLogic

Aug 2025 – Present

Software Development Engineer

- Designed and built an automated data-validation service (Java) for Walgreens' RxI pharmacy-inventory platform (8,000 stores, 9M+ daily patients) — a pipeline that reconciles REST API contracts (Rest Assured, Swagger/OpenAPI) against Cosmos DB, Azure Storage, and Databricks outputs, surfacing schema and data discrepancies before they reach production and replacing 6 weeks of manual verification per cycle.
- Investigate and resolve production incidents across a regulated, high-availability distributed system serving 9M+ patients daily — tracing an anomaly through REST APIs, Cosmos DB, Azure Storage, and Databricks to isolate exactly where records diverged, then shipping both the fix and the guardrail against recurrence.
- Shipped 14+ releases in Agile sprints — refining requirements and user stories with product managers, participating in peer reviews of code and solution designs, and presenting release readiness to external clients and stakeholders.
- Own the build and deployment path for the service: built and maintained Jenkins and Azure DevOps CI/CD pipelines (Docker) that gate every build on 300+ automated Java scenarios spanning DSCSA federal compliance, audits, returns, and stock-management workflows — raising automated coverage 65% and blocking regressions before deploy.

Method, Inc.

Jun 2025 – Aug 2025

Full-Stack Engineering Intern

- Cut internal technology-discovery time by 60% for Method's 500-engineer org by building and shipping TechDash end-to-end — a discovery platform (React, Next.js, TypeScript, Node.js/Express, Firestore on Google Cloud Functions) unifying 5 fragmented catalog types into one searchable model with real-time CRUD and cross-catalog entity linking.
- Integrated generative AI into the product on the Google Gemini API — designing prompts and response handling so engineers query unified catalog metadata in plain English alongside multi-filter structured search, across the UI, API, and data layers.
- Designed and enforced organization-wide authorization for Method's 500-person org by modeling a 3-tier RBAC scheme (admin/editor/viewer) with Firebase Auth middleware, server-protected routes, and indexed Firestore queries, making unauthorized access the default-hard path.

California State Polytechnic University, Pomona

Aug 2024 – May 2025

Computer Science Researcher, Autonomous Systems Lab

- Reduced vehicle-location update latency by 30% across 10+ simulated campus routes by building a React Native/Expo autonomous ride-sharing app integrating ROS2, GPS tracking, and YOLO-based perception.

Method, Inc.

Jun 2024 – Jul 2024

Software Engineering Intern

- Lifted learner engagement by 25% across 44,000+ employees by building a gamified quiz platform (React, Node.js, Firebase Functions, Firestore) with assessments, skill-mastery tracking, and leaderboards inside an enterprise learning portal.
- Accelerated quiz rollout by 30% by engineering secure 3-role workflows (admin/author/learner) with Google SSO, OAuth 2.0, JWT access control, and REST APIs over Firestore.

Projects

Basis - Stock Analysis & Trading Simulation Platform | [Live Demo](#) | [GitHub](#)

- Built the full-stack platform (Next.js 15, React, TypeScript, Node.js, SQLite/Drizzle ORM) serving 40+ users across the UI, API, and data layers, designing trade processing around ledger correctness — every buy, sell, and balance update reconciles exactly, with invalid trades rejected before they touch state.
- Designed the forecasting engine around evaluation gating: a walk-forward-validated model whose predictions surface only when they outperform naive baselines — refusing to show users unreliable signals — deployed via Dockerized CI/CD.

RackLab - Interactive 3D Data-Center Simulator | [Live Demo](#) | [GitHub](#)

- Built a browser-based 3D data-center simulator (React, TypeScript, Three.js/React Three Fiber, Zustand) around live observability — dashboards streaming real-time temperature, alert, and power telemetry from a simulation loop.
- Solved UI rendering and data-flow performance at scale: isolated all simulation physics into a framework-free module consumed by the HUD, 3D scene, and mission logic, covered by 38 Vitest tests — and code-splitting cut the initial payload 78% to a 64 kB gzip entry chunk, with lint, test, build, and deploy on every push.
